

Lesson 02 Demo 03

Balanced Array

Objective: To ascertain whether an array of even length can be divided into two halves with equal sums and unique elements in each half

Tools required: Visual Studio Code (VS Code) and JavaScript

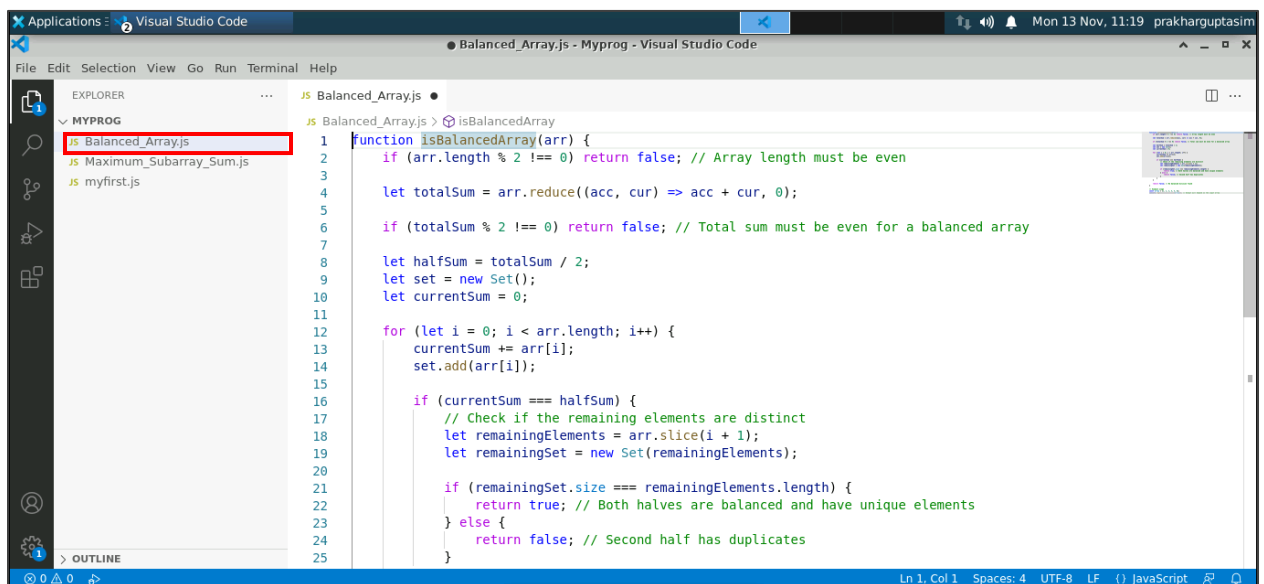

Prerequisites: Perform demo 01 of lesson 02

Steps to be followed:

1. Create the algorithm and run it

Step 1: Create the algorithm and run it

1.1 Create a JavaScript file named **Balanced_Array.js** shown below:

```
1 function isBalancedArray(arr) {
2   if (arr.length % 2 !== 0) return false; // Array length must be even
3
4   let totalSum = arr.reduce((acc, cur) => acc + cur, 0);
5
6   if (totalSum % 2 !== 0) return false; // Total sum must be even for a balanced array
7
8   let halfSum = totalSum / 2;
9   let set = new Set();
10  let currentSum = 0;
11
12  for (let i = 0; i < arr.length; i++) {
13    currentSum += arr[i];
14    set.add(arr[i]);
15
16    if (currentSum === halfSum) {
17      // Check if the remaining elements are distinct
18      let remainingElements = arr.slice(i + 1);
19      let remainingSet = new Set(remainingElements);
20
21      if (remainingSet.size === remainingElements.length) {
22        return true; // Both halves are balanced and have unique elements
23      } else {
24        return false; // Second half has duplicates
25      }
26    }
27  }
28 }
```

1.2 Paste the code in the file created in step 1.1 as shown below:

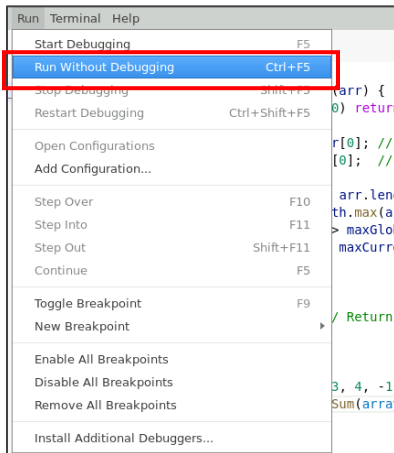

```
function isBalancedArray(arr) {
  if (arr.length % 2 !== 0) return false; // Array length must be even
  let totalSum = arr.reduce((acc, cur) => acc + cur, 0);
  if (totalSum % 2 !== 0) return false; // Total sum must be even for a balanced array
  let halfSum = totalSum / 2;
  let set = new Set();
  let currentSum = 0;
  for (let i = 0; i < arr.length; i++) {
    currentSum += arr[i];
    set.add(arr[i]);
    if (currentSum === halfSum) {
      // Check if the remaining elements are distinct
      let remainingElements = arr.slice(i + 1);
      let remainingSet = new Set(remainingElements);
      if (remainingSet.size === remainingElements.length) {
        return true; // Both halves are balanced and have unique elements
      } else {
        return false; // Second half has duplicates
      }
    }
  }
  return false; // No balanced division found
}

// Example usage
const array = [1, 2, 3, 4, 5, 6];
console.log(isBalancedArray(array)); // Output will depend on the input array
```

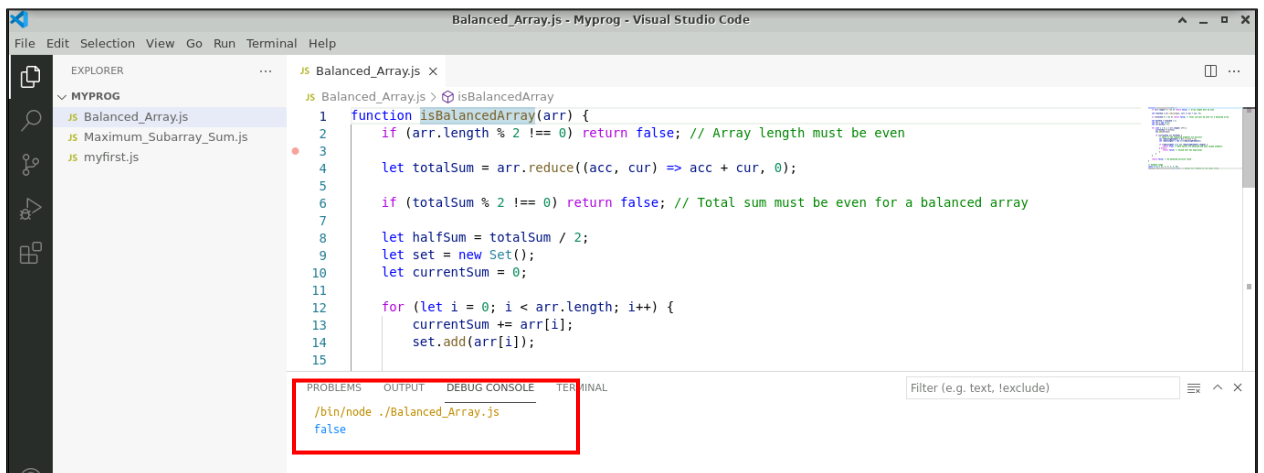

The screenshot shows a code editor with the following content:

```
JS Balanced_Array.js •
JS Balanced_Array.js > isBalancedArray
1 function isBalancedArray(arr) {
2   if (arr.length % 2 !== 0) return false; // Array length must be even
3
4   let totalSum = arr.reduce((acc, cur) => acc + cur, 0);
5
6   if (totalSum % 2 !== 0) return false; // Total sum must be even for a balanced array
7
8   let halfSum = totalSum / 2;
9   let set = new Set();
10  let currentSum = 0;
11
12  for (let i = 0; i < arr.length; i++) {
13    currentSum += arr[i];
14    set.add(arr[i]);
15
16    if (currentSum === halfSum) {
17      // Check if the remaining elements are distinct
18      let remainingElements = arr.slice(i + 1);
19      let remainingSet = new Set(remainingElements);
20
21      if (remainingSet.size === remainingElements.length) {
22        return true; // Both halves are balanced and have unique elements
23      } else {
24        return false; // Second half has duplicates
25      }
26    }
27  }
28  return false; // No balanced division found
29}
30
31// Example usage
32const array = [1, 2, 3, 4, 5, 6];
33console.log(isBalancedArray(array)); // Output will depend on the input array
```

1.3 Now save the code and click on **Run->Run Without Debugging->Node.js** to check the output in the debug console

- Now you can see the output in the debug console as shown below:

Explanation:

1. First, we check if the total sum of the array is even and the length of the array is even.
2. We calculate the half sum, which is what each half should sum up to for the array to be balanced.
3. As we iterate through the array, we keep adding elements to a set and summing up their values.
4. If, at any point, the current sum equals the half sum, we check the remaining elements in the array. If these remaining elements are all unique (checked by comparing the size of a set constructed from these elements with the length of these elements), then the array can split into two balanced halves. Otherwise, it cannot.

Conclusion:

By following the above step, you have successfully checked whether the given array is balanced or not.
